CoolPeel Delivers Natural-Looking Results With Virtually No Downtime

CoolPeel® is a brand new way to deliver the benefits of Deka CO2 laser resurfacing treatments with greater comfort and virtually no-downtime.

Reduce the appearance of wrinkles, treat small and large acne scars, and pigmentation marks on areas such as your hands, face and neck with minimum downtime. The Deka Coolpeel fractional laser features unique European-designed technology that improves results and reduces the recovery time after treatment.

What Makes CoolPeel® Different?

CoolPeel® allows your practitioner to use much lower energy but still achieve comparable results to other more aggressive treatments. The treatment is more comfortable, most patients don't need topical anesthesia at all, and most patients can be back to work wearing make-up the next day.

Who is suitable for the Coolpeel treatment?

The **CoolPeel®** treatment is suitable for almost everyone and all skin-types.

How does CoolPeel® work?

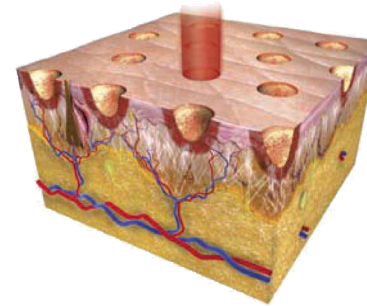

CoolPeel® uses hundreds of tiny pillars of laser energy to penetrate the skin and stimulate the body's natural collagen production, which results in smoothing the appearance of fine lines and wrinkles, reducing pigmentation, scarring and other skin irregularities.

In addition, **CoolPeel®** employs a random emission mode that creates a more natural-looking effect on the skin. Over a course of treatments you receive the benefits of an ablative resurfacing procedure but the skin can recover at a faster rate and with less discomfort or downtime.

How many treatments are necessary?

Initial results will be visible even after the first session. Three to four treatments, with minimal downtime, spaced four weeks apart can achieve optimal results for skin-rejuvenation and wrinkle reduction.

The exact number of treatments required will depend on the initial condition of your skin and the end result you desire. This is discussed during the consultation with your Doctor.

Will I need an anaesthetic?

In most cases there is no need for anaesthetic prior to the treatment. The only sensation you can expect is a slight "stinging" that only lasts a fraction of a second.

What precautions are necessary after the treatment?

Compared to traditional resurfacing treatments **CoolPeel®** now enables a significant reduction of after-treatment discomfort. It is effective and can be used for every part of your face, neck and hands, even with the most delicate skin-types. Post-treatment redness can be covered with cosmetics. The only precaution recommended is to use a suitable sunscreen for a period of time after the treatment.
